

Hope Artificial Intelligence

Scenario Based Learning

A company works with number of employees, all the works are dependents on the employees. Even if one of the employees resign the job immediately then assigned work will be not finished at the time, so delivery of the project to the clients will be delayed. Company planned to make solution for this, they want to know which employee may resign next. If they know previously, they can arrange alternative to avoid such problem. As an AI Engineer you must give Solution to this.

A) How will you achieve this in AI?

- 1.The goal is to predict whether an employee will resign (Yes or No).
- 2.The Company will have historical employee data with known outcomes (employees who resigned and those who stayed).
- 3.Since the output is a category (Yes/No), it is a classification problem.

B) Find out the 3 -Stage of Problem Identification

Machine Learning → Supervised Learning → Classification

C) Name the project

Employee Resignation Prediction.

D) Create the dummy Dataset.

Age, Salary, Years of experience, Overtime, Job satisfaction, Performance rating, Resignation Status (Yes/No)
